Can you help me with this question? I need to know the answer as soon as possible.

There is a question about the relationship between the two variables. The first variable is the number of hours spent studying, and the second variable is the score on the exam. The data shows a positive correlation between the two variables. This means that as the number of hours spent studying increases, the score on the exam also tends to increase. The correlation coefficient is 0.85, which indicates a strong positive relationship. Therefore, the answer to the question is that there is a strong positive correlation between the number of hours spent studying and the score on the exam.

The next question is about the regression line. The regression line is a straight line that best fits the data points. The equation of the regression line is $y = 0.85x + 10$, where y is the score on the exam and x is the number of hours spent studying. This equation can be used to predict the score on the exam based on the number of hours spent studying. For example, if a student spends 10 hours studying, the predicted score is $0.85(10) + 10 = 18.5$.

The final question is about the coefficient of determination. The coefficient of determination is a measure of how well the regression line fits the data. It is denoted by R^2 and ranges from 0 to 1. In this case, the coefficient of determination is 0.72, which means that 72% of the variance in the score on the exam is explained by the number of hours spent studying. This indicates that the regression line is a good fit for the data.

In conclusion, the data shows a strong positive correlation between the number of hours spent studying and the score on the exam. The regression line is a good fit for the data, and the coefficient of determination is 0.72.

Thank you for your help. I appreciate it.
